AKINDO | SoSoValue Wave 3

Buildathon submission

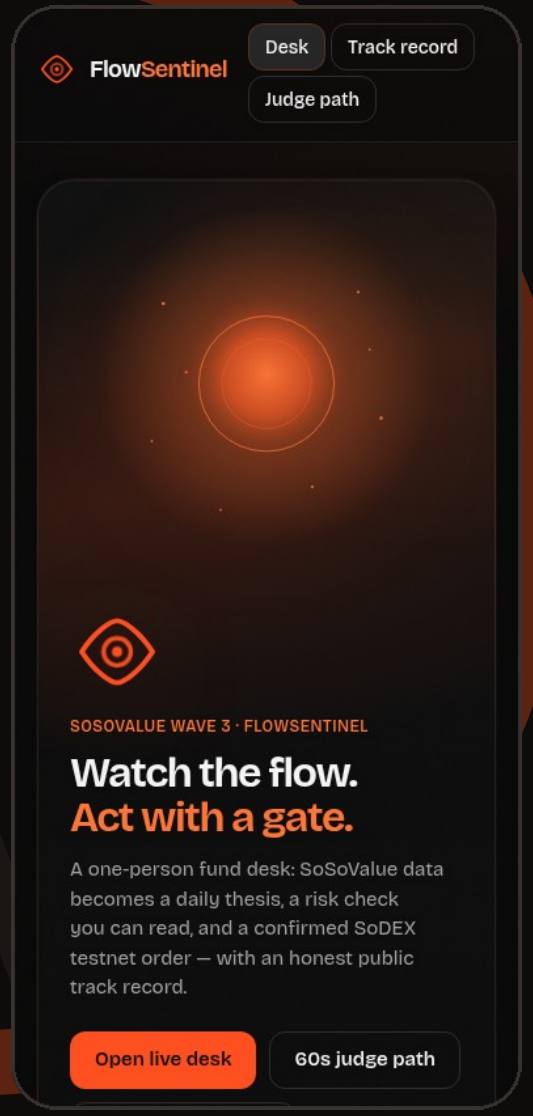

FlowSentinel

SOSOVALUE WAVE 3 BUILDATHON

FlowSentinel

Watch the flow. Act with a gate.

A one-person AI fund desk on SoSoValue data and SoDEX execution.

FlowSentinel

The problem

Data everywhere. Discipline nowhere.

ETF flows, headlines and index moves arrive all day, across a dozen tabs.

Traders react to the loudest signal, not the most relevant one.

Between a hunch and a market order there is no thesis, no size check and no stop.

Signal is cheap. A disciplined path from signal to trade is not.

The gap we close

One desk that turns every signal into a written thesis, a readable risk check and a confirmed order.

The solution

One flow from data to order

01 → 02 → 03 → 04

Data

SoSoValue ETF flows, hot news and the SSI MAG7 index

Thesis

A plain-English idea with a confidence score and cited news IDs

Risk gate

Size, drawdown and news-shock checks you can read

Order

A confirmed, EIP-712 signed order on SoDEX testnet

Every order passes all four steps. No shortcut from a headline to a fill.

SoSoValue integration

Every idea is cited

Feed	What FlowSentinel does with it
ETF flows `/etfs/summary-history`	Daily BTC and ETH ETF net flows set the direction of each thesis
Hot news `/news/hot`	Live catalysts, plus the news-shock check inside the risk gate
SSI MAG7 `index snapshot`	A wider risk-on or risk-off read on the crypto market

Cited, not guessed

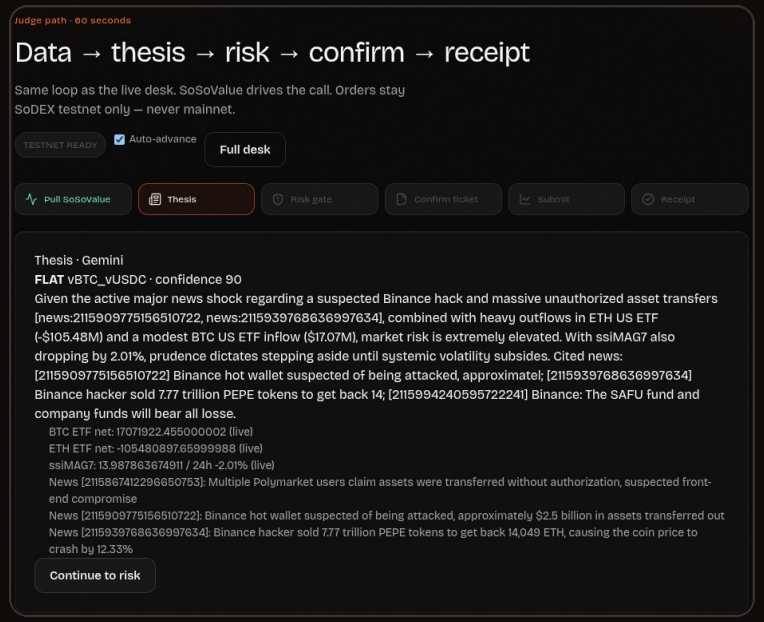

Every thesis lists the SoSoValue news IDs it used, so any claim can be traced back to its source in one click.

> The SoSoValue API key stays on the server. The browser only ever sees the result.

Jarvis, the AI advisor

It shows its work

Live thesis from the desk, news IDs cited inline

THINKS

Gemini with function calling

Pulls ETF flows, hot news, SSI, the SoDEX orderbook and an order ticket on demand.

LISTENS

Hands-free voice, in many languages

Silero VAD, Whisper STT, Kokoro or Piper TTS. All open source. Voice never places orders.

SoDEX execution

Real orders. Signed and capped.

EIP-712 signed orders, placed live on SoDEX testnet.

Two locks on every order

The risk gate must pass and you must confirm. Only then is the order signed and sent.

MARKET IOC

1301914828

Partial fill on SoDEX testnet

FILLED

1301909841

0.00005 vBTC at 78619

LIMIT

1301909840

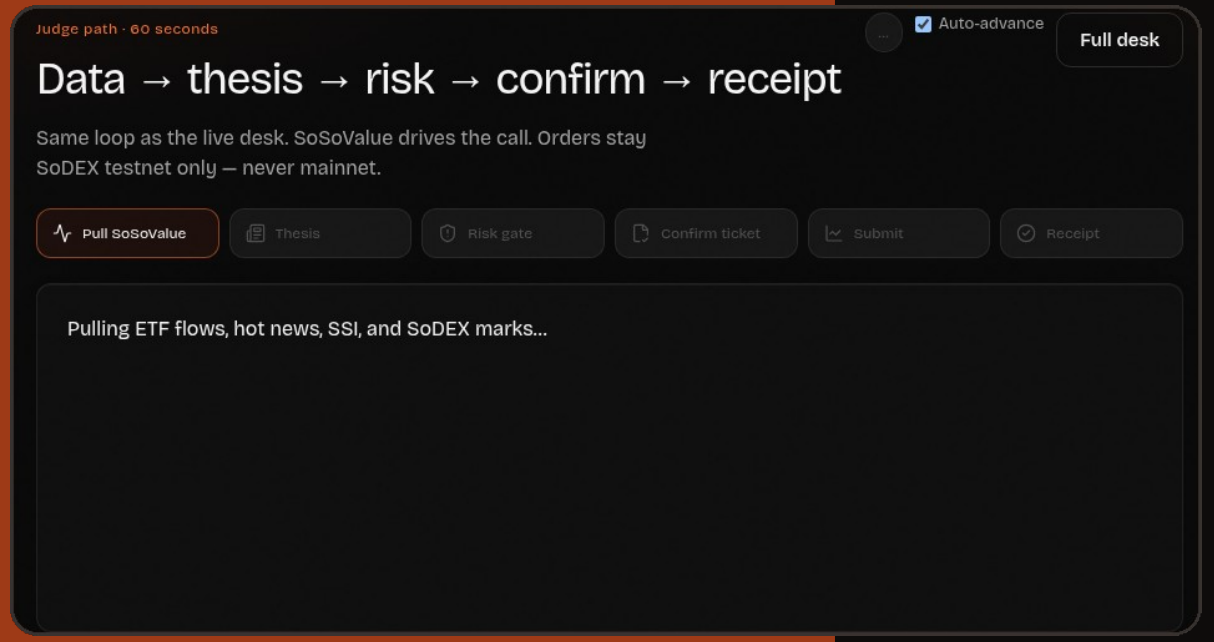

Accepted with status NEW

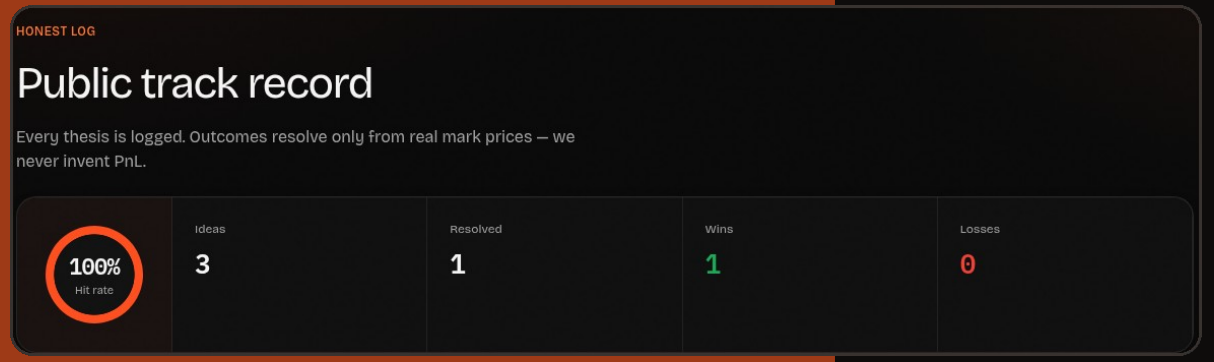

HARD CAP

10 USDC

Server-side max notional on every order

FlowSentinel

Proof, not promises

Check every claim in 60 seconds

Public track record

Every thesis is logged. Outcomes resolve only from real mark prices, so wins and losses both show.

60-second judge path

flowsentinel-app.vercel.app/judge

`/api/diag` runs live probes against every integration: 10 of 10 pass.

Tech and security

Built to be trusted with keys

Next.js

Built with Next.js and deployed on Vercel. SoSoValue, Gemini and SoDEX calls run server-side.

Gated

Keys live on the server only. Every order needs the risk gate, an explicit confirm and fits a 10 USDC cap.

95 / 93

Lighthouse score on desktop and on mobile, so the live demo loads fast on any device.

STACK | SECURITY | SPEED

FlowSentinel

Roadmap and business model

What comes after the buildathon

01

Mainnet launch. Move execution from SoDEX testnet to mainnet with the same risk gate, confirm step and caps.

02

Subscription tiers

From a free read-only desk up to paid tiers with live, gated execution.

A PLAN, NOT DATA

Mainnet, then subscriptions

Nothing on this slide is a result yet. It is where FlowSentinel goes next.

Thank you, judges. Every claim in this deck can be checked live in the app, on SoDEX testnet, or in the code.

Watch the flow. Act with a gate.

FlowSentinel, built by Narendra Varma

flowsentinel-app.vercel.app

Open it, run the judge path, then read the code.
